

## Overfitting and regularization

Quiz, 4 questions

1

point

1.

Select correct statements about overfitting:

- ☐ Overfitting happens when model is too simple for the problem
  - ☐ Overfitting is a situation where a model gives comparable quality on new data and on a training sample
  - ☐ Large model weights can indicate that model is overfitted
  - ☐ Overfitting is a situation where a model gives lower quality for new data compared to quality on a training sample
- 

1

point

2.

What disadvantages do model validation on holdout sample have?

- ☐ It can give biased quality estimates for small samples
  - ☐ It is sensitive to the particular split of the sample into training and test parts
  - ☐ It requires multiple model fitting
-

## Overfitting and regularization

Quiz, 4 questions

point

3.

Suppose you are using k-fold cross-validation to assess model quality. How many times should you train the model during this procedure?

- ☐ 1
- ☐  $k$
- ☐  $k(k - 1)/2$
- ☐  $k^2$

point

4.

Select correct statements about regularization:

- ☐ Weight penalty drives model parameters closer to zero and prevents the model from being too sensitive to small changes in features
- ☐ Weight penalty reduces the number of model parameters and leads to faster model training
- ☐ Regularization restricts model complexity (namely the scale of the coefficients) to reduce overfitting
- ☐ Reducing the training sample size makes data simpler and then leads to better quality
